

Supplementary Material

Searching for Actions on the Hyperbole

1. More implementation details

Different from Nickel *et al.* [4], which updates the prototypes sparsely, i.e., updating one column of \mathbf{P} per iteration, we update prototypes \mathbf{P} globally. The reason that we don't update sparsely is that \mathbf{P} and its gradients are small enough to fit into one GPU's memory.

For constructing the hyperbolic space, we use *geoopt*¹ library, which is equipped with \mathbb{D}_c^n , \mathbb{R}^n , \mathbb{S}^{n-1} and corresponding distance metrics, for hyperbolic manifold implementation.

2. Dataset hierarchy

Without losing semantic consistency, we slightly revise the hierarchy of ActivityNet[2] and Kinetics[1] to make the tree structure flat. We also construct hierarchy for Moments-in-Time[3] according to VerbNet[5]. Those hierarchies are listed in Fig.1, Fig.2 and Fig.3.
