Motivation

The accuracy of photometric stereo is critically dependent on the knowledge of lighting conditions: light source brightness, distribution.

Accurate knowledge of the brightness requires careful measurements with either specialized equipment (LUX meters) or reference objects with known geometry.

LEDs tend to flicker, auto-exposure is desirable, accurate distribution of lighting is hard.

[9] introduced the notion of semi-calibrated PS, proved an exact solution under classical setup and proposed an alternating optimization method.

Contribution

- Known light source positions but not brightness.
- Perspective geometry, specular reflections and non-uniform light attenuation fully modeled.
- Jointly recover geometry, albedo and specularity coefficient.

Irradiance Equation

Irradiance equation from [27]:

$$i_k(\mathbf{x}) = \rho(\mathbf{x})\phi_k a_k(\mathbf{x}, z) (\mathbf{N}(\mathbf{x}) \cdot \mathbf{W}_k(\mathbf{x}, z))^{\frac{1}{c(\mathbf{x})}}$$
(1)

where the direction of light is parametrized as the difference between the surface point $\chi \in \Sigma$ and the position of the point light source \mathbf{P}_k both dependent on the image point \mathbf{x} , that is:

$$\mathbf{L}_k(\mathbf{x}, z) = \boldsymbol{\chi}(\mathbf{x}) - \mathbf{P}_k(\mathbf{x}).$$
(2)

The perspective normal vector $\mathbf{N}(\mathbf{x})$ is parametrized according to the notation provided in [35], that is:

$$\mathbf{N}(\mathbf{x}) = \frac{1}{f} \left(f \nabla z(\mathbf{x}), -f - z(\mathbf{x}) - \mathbf{x} \cdot \nabla z(\mathbf{x}) \right)$$
(3)

and finally $\mathbf{W}_k(\mathbf{x}, z) = \mathbf{L}_k(\mathbf{x}, z) + \min \left\{ 1, \frac{|1-c(\mathbf{x})|}{\varepsilon} \right\} \mathbf{V}(\mathbf{x})$ We finally consider the following image ratio to calculate z and c:

$$\left(\frac{i_h(\mathbf{x}, z)\phi_k a_k(\mathbf{x}, z)}{i_k(\mathbf{x}, z)\phi_h a_h(\mathbf{x}, z)}\right)^{c(\mathbf{x})} = \frac{\mathbf{N}(\mathbf{x}) \cdot \mathbf{W}_h(\mathbf{x}, z)}{\mathbf{N}(\mathbf{x}) \cdot \mathbf{W}_k(\mathbf{x}, z)}.$$
(4)

that yields the following albedo independent PDE:

$$\mathbf{b}_{hk}(\mathbf{x}, z) \cdot \nabla z(\mathbf{x}) = s_{hk}(\mathbf{x}, z).$$
(5)

Following the derivation in [27], we denote the vector components with superscript indexes and by removing the dependencies for readability, the vector function \mathbf{b}_{hk} and the scalar function s_{hk} can be written as follows:

$$\mathbf{b}_{hk} = \left[(\phi_k a_k i_h)^c \left(f \overline{w}_k^1 - x^1 \overline{w}_k^3 \right) - (\phi_h a_h i_k)^c \left(f \overline{w}_h^1 - x^1 \overline{w}_h^3 \right), \\ (\phi_k a_k i_h)^c \left(f \overline{w}_k^2 - x^2 \overline{w}_k^3 \right) - (\phi_h a_h i_k)^c \left(f \overline{w}_h^2 - x^2 \overline{w}_h^3 \right) \right] \\ s_{hk} = \left(f + z \right) \left((\phi_k a_k i_h)^c \overline{w}_k^3 - (\phi_h a_h i_k)^c \overline{w}_h^3 \right).$$
(6)

and

Semi-calibrated Near-Field Photometric Stereo

¹Department of Engineering, University of Cambridge, United Kingdom ²Department of Mathematics, University of Bologna, Italy

Solving the Semi-Calibrated problem

The step-wise procedure for solving the semi-calibrated problem is based on rearranging the irradiance equation (1) so that the albedo, brightness, attenuation map and shininess parameter can be approximated. That is:

$$\rho(\mathbf{x}) = \frac{i_k(\mathbf{x})}{\phi_k a_k(\mathbf{x}, z) D_k(\mathbf{x}, z)} \quad \Rightarrow \quad \begin{bmatrix} \phi_1 a_1(\mathbf{x}, z) D_1(\mathbf{x}, z) \\ \vdots \\ \phi_{N_{img}} a_{N_{img}}(\mathbf{x}, z) D_{N_{img}}(\mathbf{x}, z) \end{bmatrix} \rho(\mathbf{x}) = \begin{bmatrix} i_1(\mathbf{x}) \\ \vdots \\ i_{N_{img}}(\mathbf{x}, z) \\ \vdots \\ i_{N_{img}}(\mathbf{x}, z) \end{bmatrix} \rho(\mathbf{x}) = \begin{bmatrix} i_1(\mathbf{x}) \\ \vdots \\ i_{N_{img}}(\mathbf{x}, z) \\ \vdots \\ i_{N_{img}}(\mathbf{x}, z) \\ \vdots \end{bmatrix}$$

where $D_k(\mathbf{x}, z) = (\mathbf{N}(\mathbf{x}) \cdot \mathbf{W}_k(\mathbf{x}, z))^{\frac{1}{c(\mathbf{x})}}$. As for the brightness,

$$\phi_{k} = \rho(\mathbf{x}) \frac{i_{k}(\mathbf{x})}{a_{k}(\mathbf{x}, z)D_{k}(\mathbf{x}, z)} \quad \Rightarrow \quad \begin{bmatrix} \rho(\mathbf{x}_{1})a_{k}(\mathbf{x}_{1}, z)D_{k}(\mathbf{x}_{1}, z) \\ \vdots \\ \rho(\mathbf{x}_{\mathbf{N}_{px}})a_{k}(\mathbf{x}_{\mathbf{N}_{px}}, z)D_{k}(\mathbf{x}_{\mathbf{N}_{px}}, z) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{\mathbf{N}_{px}}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \\ \vdots \\ i_{k}(\mathbf{x}_{1}) \end{bmatrix} \phi_{k} = \begin{bmatrix} i_{k}(\mathbf{x}_{1$$

$$c = \frac{\log(\mathbf{N} \cdot \mathbf{W}_h) - \log(\mathbf{N} \cdot \mathbf{W}_k)}{\log(i_h) + \log(\phi_k a_k) - \log(i_k) - \log(\phi_h a_h)}$$

We finally calculate light attenuation per pixel per image to go beyond the uniform light dissipation model. To avoid underconstraint problem, we assume that nearby pixels (in a small patch) have the same attenuation and solve for the attenuation of the patch. The unknowns to be calculated are: N_{patch} albedos $\rho(\mathbf{x})$, N_{patch} depths $z(\mathbf{x})$, N_{patch} shininess coefficients $c(\mathbf{x})$ and N_{imq} attenuation $a_k(\mathbf{x}, z)$.

Thus, for the number of equations to exceed the number of unknowns, we require that: $N_{imq}N_{patch} > 3N_{patch} + N_{imq} \iff$ $N_{patch} > \frac{N_{img}}{N_{img}-3}$. Hence, a 3x3 patch is good enough and so:

Figure 2: Estimation of light source brightness

Alternating Optimization

Alternate between updating all the unknowns as described above. To converge fast, follow the order:

- $\mathbf{1}\phi$: 1 scalar per image, very robust to inaccuracies.
- **2** : highly dependent on ϕ independent of ρ .
- $\odot \rho a, c$: local, sensitive properties.

Synthetic data

We considered three synthetic data cases: classic PS (orthographic projection, directional lighting, diffuse reflection), near field diffuse and near field specular (using Cook & Torrance BRDF which is not consistent with equation 1).
