### 1 Additional Implementation Details

Masked Point Modeling Reconstruction Loss: For the masked autoencoder (MAE) loss (*i.e.*,  $\mathcal{L}_{\text{recon}}$ ), we use the  $\ell_2$  Chamfer-Distance [\[3\]](#page-3-0) following [\[7\]](#page-3-1). Let  $\mathcal{R} \equiv \text{RP}(g_{\phi}^1(z_1))$  and  $\mathcal{G} \equiv X$  be the reconstructed point clouds and ground truth point clouds, respectively. The reconstruction loss  $\mathcal{L}_{recon}$  can be written as:

$$
\mathcal{L}_{\text{recon}} = \sum \left[ \frac{1}{|\mathcal{R}|} \sum_{r \in \mathcal{R}} \min_{gt \in \mathcal{G}} ||re - gt||_2^2 + \sum_{gt \in \mathcal{G}} \min_{r \in \mathcal{R}} ||re - gt||_2^2 \right]. \tag{1}
$$

Detailed Training configurations: We also provide the detailed training recipes for both the pre-training and downstream fine-tuning of our Point-CMAE in Tab. [1.](#page-1-0) Similarly to ACT  $[2]$  or Recon  $[10]$ , we adopt two kinds of augmentations (i.e., Scale&Translate and Rotation) in this work for pre-training and classification on ShapeNet [\[1\]](#page-3-4) and ScanObjectNN [\[11\]](#page-3-5) datasets, respectively.

## 2 Discussions and Additional Experiments

Differences to other related work. Integrating classic CL (*i.e.*, MOCO, BYOL) and MAE for point clouds with ViTs is challenging because MAE is transformation-sensitive but CL needs well-designed transformation [\[10\]](#page-3-3). Though [\[12,](#page-3-6) [14\]](#page-3-7) have explored this integration, our approach uniquely embeds CL within

MAE without relying on carefully designed heavy data augmentation, making our method both valuable and distinct. Though Point-CMAE and [\[12,](#page-3-6) [14\]](#page-3-7) both use MAE and contrastive learning (CL), their design logic is fundamentally different: CL in [\[12\]](#page-3-6) relies on heavy data augmentation and point matching to build contrastive pairs, while [\[14\]](#page-3-7) models contrastive constraints through spatial consistency in unmasked areas. In contrast, Point-CMAE constructs contrastive pairs within the MAE framework itself, ensuring co-masked point patches are as close as possible at the feature level. The CL in [\[6\]](#page-3-9) and our method differ notably. i) [\[6\]](#page-3-9) needs different data augmentation for two views for construction contrastive pairs while ours digging out CM within MAE (by ensuring co-masked point patches are close at the feature level). ii) [\[6\]](#page-3-9) applies CL before the decoder, while we introduce CL after it. These make our method simple and effective, without complex designs or numerous hyper-parameters.

Complex Real-World Performance. To validate the performance of the proposed Point-CMAE in a more complex level real-world setting, we fine-tune the pre-trained Point-CMAE model on the S3DIS (Aera 5) dataset, and the results are shown in Tab. [2.](#page-2-0) It shows that the proposed method also archives better performance in complex real-world experimental scenes.

Reconstruction Results. We also provide the visual results of the reconstructed point cloud via the MAE strategy.

## 3 Limitation and Future Works

While the proposed Point-CMAE achieves competitive results across various downstream tasks, it does not incorporate the multi-modal information commonly used in recent research. Future work should explore extending Point-CMAE to integrate additional modalities, such as images and depth maps, to potentially

<span id="page-2-1"></span>

Fig. 1: The reconstructed visual results of the proposed Point-CMAE.

<span id="page-2-0"></span>Table 2: Semantic segmentation results on S3DIS Area 5. We report the mean IoU(%) and mean Accuracy(%).

| Methods                  | Pretraining | mIoU $(\%) \uparrow$ | mAcc $(\%) \uparrow$ |
|--------------------------|-------------|----------------------|----------------------|
| PointNet [8]             | $\times$    | 41.1                 | 49.0                 |
| $PointNet++[9]$          | $\times$    | 53.5                 |                      |
| PointCNN [4]             | $\times$    | 57.3                 | 63.9                 |
| Point-BERT [16]          |             | 68.9                 | 76.1                 |
| MaskPoint [5]            |             | 68.6                 | 74.2                 |
| Point-MAE <sup>[7]</sup> |             | 68.4                 | 76.2                 |
| Point-CMAE (Ours)        |             | 69.8                 | 77.0                 |

enhance its performance. Additionally, the current work employs the same mask ratio for both masks. Investigating the impact of varying the mask ratios could provide deeper insights into the invariance properties of Vision Transformers (ViTs) for point cloud representation learning. This could further refine our understanding and improve the model's robustness and generalization capabilities. Besides, exploring SSL with large-scale point clouds is an interesting related area that we would like to explore as well as one of the future directions.

### 4 Broader Impact

Our research introduces Point-CMAE, an innovative approach integrating contrastive learning with masked autoencoder pre-training for Vision Transformers in 3D point cloud data. This advancement enhances 3D object recognition and segmentation, improving applications like autonomous driving and robotics while promoting data efficiency, and making robust models feasible even with limited labeled data. The techniques developed can inspire innovations in other domains, fostering cross-disciplinary advancements. By releasing our code, we contribute to the open-source community, facilitating collaboration and reproducibility. Point-CMAE also serves as a valuable educational resource, while its ethical application can enhance societal benefits.
