Doppler-Aware LiDAR-RADAR Fusion for Weather-Robust 3D Detection

Supplementary Material

1. Implementation Details

Following the official paper of K-RADAR dataset, point clouds within the driving corridor were used for the experiment, with the x-axis range (0, 72m), y-axis range (-6.4, 6.4m), and z-axis range (-2, 6m). The voxel size was set to 0.4 × 0.4 × 0.4m, and the preprocessing bin size with Δd was set to 0.2. The number of MPII and stages was set to b=3. Training was conducted with a batch size of 4 using the Adam optimizer with lr=1e-3, β_1=0.9, β_2=0.999 until performance convergence. A single A6000 GPU is utilized for training and evaluation. The total training time is around 1∼1.5 days with full K-RADAR trainset. The current inference speed is around 20ms per sample, which is below real-time. However, this is primarily due to the unoptimized NumPy-based neighbor search. Replacing it with a PyTorch implementation or using TensorRT is expected to significantly improve the speed, potentially beyond real-time.

2. Additional Quantitative Comparison

We report quantitative comparison with additional baselines [2], student model of [1], and [4]. Those were not included in the main comparison for the following reasons: [1] fuses camera data in addition to LiDAR and radar, and [2] uses a LiDAR–4D radar fusion model as the teacher, but explores a different KD strategy for the student. We believe DLR-Fusion could also benefit from such a KD, and thus did not consider it a direct comparison. [3] is a recent work utilizing the denoising strategy. Since we believe that a broader comparison is valuable, therefore the results were summarized in the extended Table 1. As shown, our DLRFusion shows comparable results to the models that use camera input or KD, and even surpasses both the teacher and student models of [1] under IoU=0.5. While [4] benefits from denoising strategies, our method also shows superior performance in several aspects such as AP_{BEV} at IoU=0.3.

Table 1. Quantitative comparison with more baselines.

	IoU=0.3		IoU=0.5	
	AP_{BEV}	AP_{3D}	AP_{BEV}	AP_{3D}
3D-LRF [2]	84.0	74.8	73.6	45.2
Teacher of [1]	82.1	73.2	71.3	40.4
Student of [1]	83.3	75.6	72.4	43.3
L4DR [4]	79.5	78.0	77.5	53.5
DLRFusion	82.9	74.8	73.2	45.7

3. Further Qualitative Analysis

We provide more qualitative detection results on K-RADAR dataset under various weather conditions. The qualitative detection results of RTNH [7], RTNH[†] [7], PointPillars [5], VoxelNext [3], InterFusion [8], BEVFusion[†] [6], and DLRFusion (ours) are reported. Fig. 1 shows overall qualitative results extended from the Fig. 3 in the main paper. Fig. 2 ∼ 8 shows results under normal, overcast, fog, rain, sleet, light snow and heavy snow, respectively. As shown in the figures, our DLRFusion achieves the most accurate classification and precise regression across various weather conditions. This demonstrates the effective fusion of LiDAR and 4D RADAR's power and Doppler. Specifically, LiDAR-based methods experience misdetections and incorrect detections due to adverse weather noise and occlusion. In environments such as fog, rain, sleet, and snow, LiDAR points significantly decrease, and in rainy conditions, the LiDAR point distribution becomes scattered. In contrast, RADAR-based methods struggle with accurately predicting bounding boxes due to RADAR's weaker structural boundary information. In some cases, RADAR can confuse structures with objects, especially when power information alone is present in areas where no objects should exist. Other RADAR-LiDAR fusion methods often face difficulties when one modality is unclear, making it challenging to determine which modality's results to trust. In contrast, our method can discern non-object areas even when confusion arises between modalities. Through multi-path interaction, it recognizes when dynamic information is insufficient, even when power is strong. As demonstrated in the sample in Fig. 7 on the right, our method shows robust performance, accurately aligning the direction of vehicles, even when their trajectories are not perfectly linear.
