Imperial College London

Overview

- We propose Transition Forests: a temporal decision forest model for human actio and detection.
- Growing trees tends to group frames that have similar temporal transitions and sh
- Trees are grown for different temporal orders and combined in prediction.
- Efficient and online per-frame inference.

• Transitions as frames traveling from node i to node j in d time-steps on a given

 $T_i^{\mathcal{I}} = \{\{(x_{t-d}, y_{t-d}), (x_t, y_t)\} \mid (x_{t-d}, y_{t-d}) \in S_i \land (x_t, y_t) \in S_j\}.$

Learning transition forests

• Objective function for one layer of the tree:

$$\min_{\{\theta_i\}} E_c(\{\theta_i\}_{i \in N_c}) + E_t(\{\theta_i\}_{i \in N_c \cup N_t}),$$

where E_c is the classification loss on single frames, N_c and N_t are the layer nodes range assigned to be optimized using either classification or transition objective functions.

• Transition objective function:

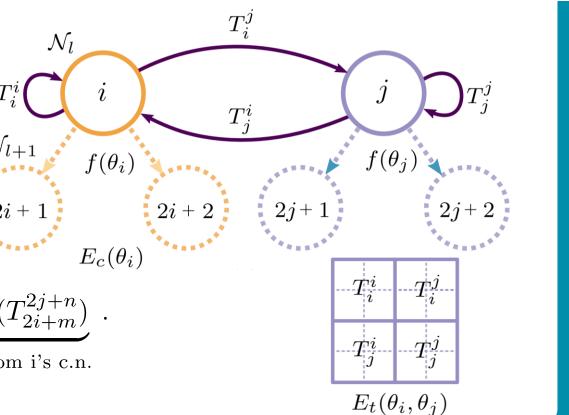

$$E_t(\theta_j) = \sum_{m,n \in \{1,2\}} |T_{2j+m}^{2j+n}| H(T_{2j+m}^{2j+n}), \text{ with } H(T_{(.)}^{(.)}) \text{ the Shannon}$$

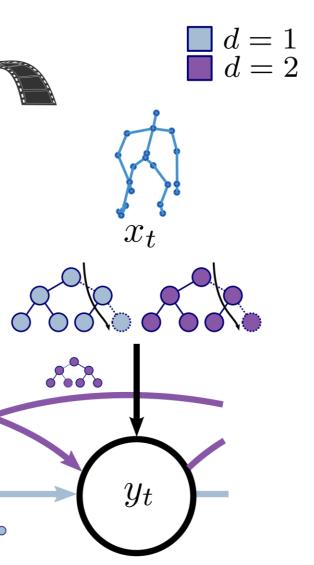

Transition Forests: Learning Discriminative Temporal Transitions for Action Recognition and Detection Guillermo Garcia-Hernando and Tae-Kyun Kim Imperial College London

Capturing distant node transitions (within a layer):
We process an iterative approach to minimize the objective function (algorithm box in the paper).
F(
$$\theta$$
) (θ_i) ($_{i,j \in N_i \rightarrow N_i}$) = $\sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
 $+ \sum_{\substack{w_i = \{1,2\}\\ w_i = \{1,2\}}}^{bareous re-duil modes (w + i)} (x_{i,j})$
