A. Detailed Architecture

Table 1 details the network architecture used in the experiments on the CIFAR-10 dataset. It is based on PreAct ResNet-32 [1].

B. Dependency on Hyper Parameters

We show the hyper parameters used in the experiments on SN-CIFAR in Table 2. If the noise rate is high, the optimal learning rate also tends to be high.

The prediction accuracy is not so sensitive to the hyper parameters and our method demonstrated good performance with a different set of the hyper parameters as shown in Table 3, 4, 5, 6. In addition, Table 7, 8 show the validation accuracy with different t_1 and t_2 , where t_1 is the value at which to start label-updating, and t_2 is the value at which to stop label-updating. When we train the network with a high learning rate, the prediction accuracy retains high value, and thus we can start label-updating when the validation accu-

Table 1. The network architecture used in the experiments on CIFAR-10.

| NAME | DESCRIPTION |
|--------|--|
| input | 32×32 RGB image |
| conv | 32 filters, 3×3, pad=1, stride=1 |
| unit1 | (pre-activation Residual Unit 32→32)×5 |
| unit2a | pre-activation Residual Unit 32→64 |
| unit2b | (pre-activation Residual Unit 64→64)×4 |
| unit3a | pre-activation Residual Unit 64→128 |
| unit3b | (pre-activation Residual Unit 128→128)×4 |
| pool | Batch Normalization, ReLU, Global average pool (8×8→1×1 pixels) |
| dense | Fully connected 128→10 |
| output | Softmax |

Table 2. The hyper parameters used in the experiments on SN-CIFAR.

| noise rate (%) | 0 | 10 | 30 | 50 | 70 | 90 |
|----------------|------|------|------|------|------|------|
| α | 1.2 | 1.2 | 1.2 | 1.2 | 1.2 | 0.8 |
| β | 0.8 | 0.8 | 0.8 | 0.8 | 0.8 | 0.4 |
| learning rate | 0.01 | 0.02 | 0.03 | 0.04 | 0.08 | 0.12 |

racy once reach high value. Label-updating should be stopped after the training loss converge.

Table 3. Validation accuracy with different hyper parameters in the triple test (experimented on AN-CIFAR with noise rate = 0.4).

| $\beta = 0.4, \text{ learning rate} = 0.03$ | | | | | | | |
|--|-------|------|------|-------------|------|------|------|
| α | 0.1 | 0.2 | 0.5 | 0.8 | 1.0 | 2.0 | 5.0 |
| val (%) | 91.9 | 92.0 | 91.7 | 92.0 | 92.1 | 92.1 | 88.8 |
| $\alpha = 0.8, \text{ learning rate} = 0.03$ | | | | | | | |
| β | 0.05 | 0.1 | 0.2 | 0.4 | 0.5 | 1.0 | 2.0 |
| val (%) | 90.8 | 91.7 | 91.8 | 92.0 | 91.6 | 89.5 | 91.1 |
| $\alpha = 0.8, \beta = 0.4$ | | | | | | | |
| learning rate | 0.005 | 0.01 | 0.02 | 0.03 | 0.05 | 0.1 | 0.2 |
| val (%) | 90.6 | 90.9 | 91.3 | 92.0 | 92.1 | 91.3 | 88.5 |

Table 4. Validation accuracy with different hyper parameters in the triple test (experimented on AN-CIFAR with noise rate = 0.2).

| $\beta = 0.4, \text{ learning rate} = 0.03$ | | | | | | | |
|--|-------|------|------|-------------|------|------|------|
| α | 0.1 | 0.2 | 0.5 | 0.8 | 1.0 | 2.0 | 5.0 |
| val (%) | 92.9 | 92.9 | 93.0 | 93.2 | 93.1 | 93.2 | 89.7 |
| $\alpha = 0.8, \text{ learning rate} = 0.03$ | | | | | | | |
| β | 0.05 | 0.1 | 0.2 | 0.4 | 0.5 | 1.0 | 2.0 |
| val (%) | 92.6 | 93.0 | 93.2 | 93.2 | 93.1 | 92.8 | 92.8 |
| $\alpha = 0.8, \beta = 0.4$ | | | | | | | |
| learning rate | 0.005 | 0.01 | 0.02 | 0.03 | 0.05 | 0.1 | 0.2 |
| val (%) | 92.5 | 92.7 | 92.7 | 93.2 | 92.7 | 91.8 | 89.2 |

Table 5. Validation accuracy with different hyper parameters in the triple test (experimented on SN-CIFAR with noise rate = 0.7).

| $\beta = 0.8, \text{ learning rate} = 0.08$ | | | | | | | |
|--|-------|------|------|------|-------------|------|------|
| α | 0.1 | 0.2 | 0.5 | 1.0 | 1.2 | 2.0 | 5.0 |
| val (%) | 85.7 | 86.0 | 85.5 | 85.9 | 85.5 | 85.7 | 83.8 |
| $\alpha = 1.2, \text{ learning rate} = 0.08$ | | | | | | | |
| β | 0.05 | 0.1 | 0.2 | 0.5 | 0.8 | 1.0 | 2.0 |
| val (%) | 82.0 | 82.3 | 83.1 | 85.3 | 85.5 | 85.2 | 30.3 |
| $\alpha = 1.2, \beta = 0.8$ | | | | | | | |
| learning rate | 0.005 | 0.01 | 0.02 | 0.05 | 0.08 | 0.1 | 0.2 |
| val (%) | 79.5 | 80.7 | 82.8 | 85.4 | 85.5 | 85.4 | 83.8 |

Table 6. Validation accuracy with different hyper parameters in the triple test (experimented on SN-CIFAR with noise rate = 0.3).

| $\beta = 0.8$, learning rate = 0.03 | | | | | | | |
|---------------------------------------|-------|------|------|-------------|------------|------|------|
| α | 0.1 | 0.2 | 0.5 | 1.0 | 1.2 | 2.0 | 5.0 |
| val (%) | 91.6 | 91.7 | 91.5 | 91.8 | 91.8 | 91.8 | 89.9 |
| $\alpha = 1.2$, learning rate = 0.03 | | | | | | | |
| β | 0.05 | 0.1 | 0.2 | 0.5 | 0.8 | 1.0 | 2.0 |
| val (%) | 90.0 | 90.4 | 91.2 | 91.8 | 91.8 | 91.9 | 91.0 |
| $\alpha = 1.2$, $\beta = 0.8$ | | | | | | | |
| learning rate | 0.005 | 0.01 | 0.02 | 0.03 | 0.05 | 0.1 | 0.2 |
| val (%) | 90.1 | 90.7 | 91.0 | 91.8 | 92.1 | 91.1 | 89.0 |

Table 7. Validation accuracy with different t_1 (start epoch) and t_2 (stop epoch) in the triple test (experimented on AN-CIFAR with noise rate = 0.4, $\alpha = 0.8$, $\beta = 0.4$, learning rate = 0.1).

| | | | | | |
|-------------|------|------|------------|------|------|
| start epoch | 0 | 50 | 70 | 100 | 150 |
| val (%) | 58.4 | 90.3 | 91.3 | 91.4 | 91.6 |
| stop epoch | 100 | 150 | 200 | 250 | 300 |
| val (%) | 91.8 | 91.5 | 91.3 | 90.8 | 90.7 |

Table 8. Validation accuracy with different t_1 (start epoch) and t_2 (stop epoch) in the triple test (experimented on SN-CIFAR with noise rate = 0.7, $\alpha = 1.2$, $\beta = 0.8$, learning rate = 0.08).

| | | | | | |
|-------------|------|------|------------|------|------|
| start epoch | 0 | 50 | 70 | 100 | 150 |
| val (%) | 38.0 | 84.7 | 85.5 | 86.1 | 85.6 |
| stop epoch | 100 | 150 | 200 | 250 | 300 |
| val (%) | 85.0 | 85.6 | 85.5 | 85.9 | 85.6 |

C. Effect of Soft-Labeling

We show the analysis of the effect of soft-labeling on the noisy CIFAR-10 dataset in Table 9, 10. The soft-labels with high probability are almost correct. Conversely, when the probability is low, the label seems to be updated incorrectly. As opposed to the hard-labels, the soft-labels contain the probabilities of each class in themselves, and thus the network can consider the incorrectly updated labels as not important.

Table 9. Recovery accuracies of the updated soft-labels whose maximum probabilities p are within each range (experimented on AN-CIFAR with noise rate = 0.4).

| p | 1 - 0.99 | 0.99 - 0.95 | 0.95 - 0.9 | 0.9 - 0 | 1 - 0 |
|---------|----------|-------------|------------|---------|-------|
| acc (%) | 99.8 | 96.9 | 91.3 | 73.1 | 95.1 |
| number | 27046 | 8647 | 3484 | 5823 | 45000 |

Table 10. Recovery accuracies of the updated soft-labels whose maximum probabilities p are within each range (experimented on SN-CIFAR with noise rate = 0.7).

| p | 1 - 0.99 | 0.99 - 0.95 | 0.95 - 0.9 | 0.9 - 0 | 1 - 0 |
|---------|----------|-------------|------------|---------|-------|
| acc (%) | 97.5 | 82.2 | 70.6 | 53.3 | 86.4 |
| number | 27591 | 7368 | 3351 | 6690 | 45000 |
